

## Physics 2320: Spring 2007: Problem Set 2

1. The  $S'$  inertial frame has its  $x$ ,  $y$ , and  $z$  axes aligned with those of the  $S$  inertial frame and moves along the  $x$  axis of the  $S$  frame with a velocity  $v$ . The coordinates are arranged so that the origins coincide at  $t = t' = 0$ . Experimenters are located in the  $S$  frame at  $(x_A, 0, 0)$  and  $(x_B, 0, 0)$  and each holds a ping-pong ball. They plan to drop these ping-pong balls at different times so that the two events are simultaneous for observers in the  $S'$  frame. Calculate what the difference in time of their actions must be.
2. The  $S'$  inertial frame is aligned and moves relative to the  $S$  inertial frame as described in problem 1. Here the velocity  $v = 0.96 c$ . Particles with a mean life of  $10^{-6}$  seconds in their rest frames are located at the origin of the  $S'$  frame. Calculate the apparent mean life that an experimenter in the  $S$  frame would measure.
3. The  $S'$  inertial frame is aligned and moves relative to the  $S$  inertial frame as described in problem 1. Here the velocity  $v = 0.64 c$ . A meter stick lies along the  $x$  axis of the  $S'$  frame. Calculate its apparent length as observed by experimenters in the  $S$  frame.
4. The  $S'$  inertial frame is aligned and moves relative to the  $S$  inertial frame as described in problem 1. A clock is placed at the origin of the  $S$  inertial frame. Demonstrate the time dilation of this clock as viewed by an observer in the  $S'$  frame using the technique shown in lecture.
5. The  $S'$  inertial frame is aligned and moves relative to the  $S$  inertial frame as described in problem 1. The experimenters in the  $S$  frame place a rod of length  $L(0)$  along the  $x$  axis. Demonstrate the contraction in the length of this rod as viewed by two observers in the  $S'$  frame using the technique shown in lecture.
6. The  $S'$  inertial frame is aligned and moves relative to the  $S$  inertial frame as described in problem 1. In lecture we derived formulas to transform a velocity  $u_x$ ,  $u_y$ ,  $u_z$  in the  $S$  frame to a velocity in the  $S'$  frame. A beam of light moves in the  $S$  frame; hence

$$u_x^2 + u_y^2 + u_z^2 = c^2 .$$

Use the formula from lecture to transform the velocity to the  $S'$  frame and show that

$$u'_x{}^2 + u'_y{}^2 + u'_z{}^2 = c^2 .$$

7. The  $S'$  inertial frame is aligned and moves relative to the  $S$  inertial frame as described in problem 1. If one knows the velocity  $u'_x$ ,  $u'_y$ ,  $u'_z$  in the  $S'$  frame, derive formulas to transform these to the  $S$  frame using the technique shown in lecture.
