

Program Procedures

Each assignment must be submitted in PDF format and will consist of **three sections**.

- The **first** section will include the computer code you have written. This code should be well documented so that it can be easily understood by someone other than the author.
- The **second** section will include the output generated by your programs.
- The **third** section will contain a summary of your calculations.

-- Code may not contain any high-level functions. For example you can't use Maple's **fsolve** command when trying to solve an equation. Your code must be based on control loops and if-else statements. If you use Maple and a procedure uses a derivative of a function, the derivative must be passed to the procedure as an argument. You may not compute derivatives inside of a procedure.
