Assume that the distance d taken to stop a moving car of mass m depends on its speed v and on the ratio F/m, where F is the magnitude of the frictional force exerted on the car when it brakes. Select the option that gives a form of the relationship that might be predicted using the method of dimensional analysis, where k is a dimensionless constant.

$$\mathbf{A} \quad d = kv \left(\frac{F}{m}\right)^{-1} \qquad \quad \mathbf{B} \quad d = kv \left(\frac{F}{m}\right)^{-2}$$

$$\mathbf{C} \quad d = kv^{2} \left(\frac{F}{m}\right)^{-2} \qquad \mathbf{D} \quad d = kv^{-2} \left(\frac{F}{m}\right)^{-1}$$

$$\mathbf{E} \quad d = kv^{2} \left(\frac{F}{m}\right)^{-1} \qquad \mathbf{F} \quad d = kv^{-2} \left(\frac{F}{m}\right)^{2}$$

$$\mathbf{G} \quad d = kv^{2} \left(\frac{F}{m}\right) \qquad \mathbf{H} \quad d = kv^{-2} \left(\frac{F}{m}\right).$$

$$\mathbf{E} \quad d = k v^2 \left(\frac{F}{m}\right)^{-1} \qquad \mathbf{F} \quad d = k v^{-2} \left(\frac{F}{m}\right)^2$$

$${f G} \quad d = k v^2 \left(rac{F}{m}
ight) \qquad \quad {f H} \quad d = k v^{-2} \left(rac{F}{m}
ight)$$
