

### Binomial Theorem Question:

Find the **constant term** in the expansion of  $\left(\frac{1}{2x^3} + x\right)^{20}$ .

[The constant term is the summand which does not involve any power of  $x$ . For example the constant term in  $3x^2 - 4x + 23 + 9x^{10} + \frac{5}{3x^6}$  is 23.]
